

Mobile Hamburger Menu

The user will click on the hamburger menu icon to get to other pages of the website. When the hamburger icon is clicked, a menu dropdown will appear with the core navigation items under the header. The hamburger icon will also change to a close icon in order to let users know that you will exit the dropdown when that icon is clicked.

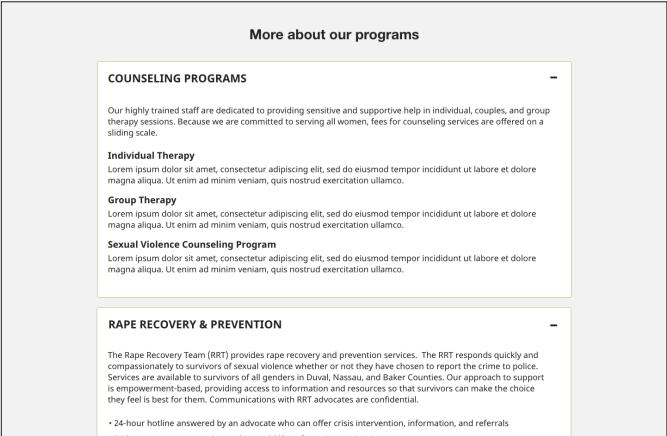

Navigation Sub-Menu
Drop Down

As the website requires more than a handful of pages, a sub-menu drop down is necessary for users to view other pages not displayed in the primary navigation. A user will hover over a navigation item in the header in order for the dropdown to appear. As a user hovers over a specific item, the background will change color to a light gray shade which will indicate that they are viewing a sub-menu under that category. Users will then be able to click on whichever sub-menu item they want to navigate to.

Accordion

The accordion element on the site is designed within a rectangular shape with a plus symbol to indicate that you can interact with it. Once a user clicks on an accordion item (the rectangle), more information about the item is shown. The plus icon is shown when the accordion is closed in order to show that additional information will appear below when clicked, and icon will change to a minus symbol when the accordion is opened in order to indicate that you can collapse the accordion, hiding additional information when clicked.

Quote Circle

This UI element will use the random quotes API to return a random quote of the day. The circle will include copy inside that indicates that the element is interactive. Once the user clicks the element, a random quote will appear (in regular font weight) which will be dynamically pulled in from the **Advice Slip API**.
